Profiles

 LinkedIn

Summary

Self-driven DevOps enthusiast with hands-on experience in automation, containerization, and secure deployment workflows. Skilled in Docker, Python, Bash, and CI/CD automation using GitHub Actions. Focused on building scalable, efficient, and maintainable infrastructure solutions.

Languages

Python	Bash
YAML	JSON

Skills

CICD GitHub Actions, GitLab CI	Cloud Platforms AWS, Akamai Linode
Infrastructure as Code Terraform, Terraform Cloud, Ansible	Observability Prometheus, Loki, Grafana, Grafana Alloy
Orchestration Linode LKE, K3d, K3s, Helm, Kubernetes, Docker Compose	Version Control Git, GitHub, Gitea, GitLab

Projects

Push-Based CICD for Webapp Deployment

- Made **GitHub Action Workflows** that Build, Provision & Deploy a Simple Webapp on **Linode LKE** which is **Akamai Linode's Managed Kubernetes Engine**.
- Used **GitHub Action** to Build Container Image of the Simple Webapp & Uploaded it to the Private **GHCR** of the GitHub Repository.
- Used **Terraform** to Provision a Managed Kubernetes Cluster using **Linode LKE** Provider on Linode Cloud Provider.
- Used **Helm Charts** with **Kubernetes** Secrets to Deploy the Webapp & Maintain the Desired State on the Provisioned **Linode LKE** Cluster Securely.
- Achieved Seamless, Highly Available **Push-Based CICD** Deployment for the Simple Webapp with minimal Manual Interaction.

CICD: GitHub Actions, GHCR, Terraform, Helm, Kubernetes, Linode

Grafana Monitoring Dashboard

- Configured **Prometheus** to scrape and store the System and Container metrics using Pull-Based Collection for Real-Time Performance Tracking.
- Set up **Loki** to Receive and Index Log Streams from **Grafana Alloy**, enabling scalable and efficient Log Aggregation and Search.
- Utilized **Grafana Alloy** as a Unified Agent to collect both Metrics and Logs, simplifying the Observability pipeline into a single service.
- Deployed **Grafana** to create Centralized Dashboards that correlate Resource Usage Metrics with Live Application Logs.
- Managed Orchestration using **Docker Compose** to deploy **Prometheus, Loki, Grafana**, and **Alloy** in a consistent, reproducible environment.

Observability: Prometheus, Loki, Grafana Alloy, Grafana, Docker Compose

Automated Docker Compose Deployment

- Deployed **Gitea** and **Gitea Runner** using **Docker Compose** on a local homelab host to establish a self-hosted CICD environment.
- Configured **Gitea Actions** workflows to trigger on specific commit message, Automating the setup of Docker and **Tailscale**, used for **Zero-Trust Networking**, within the runner.
- Established secure **SSH** connectivity from the runner to a dedicated "deploy" user on the host via the **Tailscale mesh network**.
- Automated file transfer and execution by syncing **Docker Compose** manifests to a production directory and remotely running ``docker compose up -d``.
- Hardened Deployment Security by Isolating the Deployment Environment within a specific User Home Directory and utilizing Zero-Trust Networking.

CICD: Gitea, Gitea Actions, Docker Compose, Tailscale, SSH

Education

Indira College of Engineering & Management, Pune	5.9/10
B.E. Computer Engineering	2025
